4. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **rokyuddin.com** for a **Personal portfolio / frontend developer** site, generated on August 25, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

61/100

SEO HEALTH SCORE

Critical Issues Found:

1. **Info:** CRITICAL: www/non-www canonical conflict — site serves on www but every canonical/sitemap/schema/robots URL declares non-www, which 308-redirects back to www (self-contradicting, origin is SITE_URL default in src/lib/site.ts)
2. **Info:** CRITICAL: Site-wide Person + WebSite schema and index CollectionPage schema never reach served HTML — rendered via next/script and RSC flight payload, invisible to crawlers (layout.tsx regression)
3. **Info:** HIGH: Broken default social image — /twitter-image.jpg returns 404, breaks og:image/twitter:image on 6 pages
4. **Info:** HIGH: Mobile LCP 4.7s (POOR) driven by 424KB JS + GA4 (167KB, 42% unused) preloaded high-priority; hero image lacks fetchpriority=high
5. **Info:** HIGH: Domain migrated from rokyuddin.vercel.app (now 404, no redirect) to new rokyuddin.com created 2026-08-19 — no link equity transfer, near-zero authority

Quick Wins:

1. Fix layout.tsx: replace next/script <Script> with plain <script type=application/ld+json> for Person+WebSite (5-min fix, makes site-wide schema visible)
2. Set NEXT_PUBLIC_SITE_URL=https://www.rokyuddin.com to resolve the canonical/www conflict across all channels
3. Fix DEFAULT_SOCIAL_IMAGE from /twitter-image.jpg (404) to /twitter-image
4. Add priority (fetchpriority=high) to the hero <Image> and stop high-priority-preloading GA4
5. Fill or remove the empty Client Testimonials section

2. Audit Categories

2.1 Technical SEO

Score: **62/100**

What Works

- All 10 pages return 200 and are indexable (no noindex/X-Robots-Tag on main pages)
- HTTPS enforced (308 on both hosts), HSTS present (max-age=63072000)
- Valid XML sitemap, /sanity correctly Disallowed + noindexed
- Viewport + lang=en on all pages, trailing-slash normalization correct, no dead links
- Responsive single-host mobile (no m. duplication)

Findings

www/non-www canonical conflict (self-contradicting setup) Critical

Site serves on www.rokyuddin.com (non-www 308-redirects to www on every path), but `SITE_URL` (`src/lib/site.ts`, default non-www) drives all 10 canonicals, `og:url`, `metadataBase`, `robots Host/Sitemap`, `sitemap <loc>`, and schema URLs to non-www — a host that redirects back to www. Every declared canonical points at a URL that 308s.

Recommendation: Set `NEXT_PUBLIC_SITE_URL=https://www.rokyuddin.com` (or change the `site.ts` default); keep the 308; resubmit sitemap and confirm `https://www.rokyuddin.com` GSC property.

Broken default social image (/twitter-image.jpg returns 404) High

`DEFAULT_SOCIAL_IMAGE='/twitter-image.jpg'` 404s; real dynamic route is `/twitter-image` (200, PNG). Breaks `og:image/twitter:image` on 6 pages (blog index, 3 posts, case-studies index, playground). Homepage uses a Sanity OG image instead (~1MB, oversized).

Recommendation: Change `DEFAULT_SOCIAL_IMAGE` to `/twitter-image` (no extension).

Missing security headers Medium

Only HSTS set (no `includeSubDomains/preload`). No CSP, `X-Content-Type-Options`, `Referrer-Policy`, `X-Frame-Options`, or `Permissions-Policy`.

Recommendation: Add security headers via `next.config.ts` or Cloudflare; strengthen HSTS once the www host is finalized.

2.2 Content Quality

Score: **60/100**

What Works

- Strong homepage E-E-A-T: named employers with dates, 3+ years, public resume, verifiable contact (email/phone/location)
- Case studies are substantive engineering narratives with dated, specific detail (durations, teams, outcomes)
- Clear H2/H3 passage structure ideal for extraction

Findings

Blog is dormant and extremely thin (3 posts, Nov 2024, ~135-200 words) High

All 3 blog posts date Nov 2024 (~21 months stale), run ~135-200 words while claiming '5-8 min read'. 'Modern Web Design Trends 2024' is structurally time-obsolete. Cannot win their target SERPs in 2026 and drags down E-E-A-T recency perception.

Recommendation: Refresh with current-dated deep posts (1500-2500 words with real code/data), or soft-remove the 2024 trends post and stubs until they meet depth.

Missing About, Contact pages and persistent footer High

No About page, no standalone Contact page, no persistent footer on content pages — 'Get in Touch' on blog/case-study pages points to an #contact anchor that only exists on the homepage.

Recommendation: Add About + Contact pages and a site-wide footer with contact/social links.

Empty Client Testimonials section Medium

Homepage renders '04 Client Testimonials' heading with testimonials:[] (empty) — a visible trust/E-E-A-T hole.

Recommendation: Fill with 2-3 named, role-attributed testimonials, or remove the section.

Case-study metrics unverifiable / duplicate descriptions Medium

Headline results (99.9% uptime, 100% accessibility, 10x) are self-reported with no source/screenshot; the same description is duplicated verbatim across homepage card, index card, and page meta description (self-competition).

Recommendation: Back each metric with a link/screenshot; differentiate descriptions across URLs.

2.3 On-Page SEO

Score: **72/100**

What Works

- All 10 pages have unique title tags and meta descriptions
- All pages have canonical tags; homepage H1 'Md Rokyuddin' present above the fold (server-rendered)
- Clear heading hierarchy (H1 > H2 > H3) across pages

Findings

Every blog post has two H1 tags **Medium**

Duplicate H1 (visible H1 plus a repeated in-body H1) on all 3 blog posts.

Recommendation: Keep exactly one H1 per page.

Duplicate meta descriptions / copy across case-study URLs **Medium**

Case-study meta description = Project Overview paragraph = homepage/index card text; blog index cards repeat meta description as intro.

Recommendation: Write distinct descriptions per URL.

Playground has no H1 and minimal on-page content **Low**

Playground is a JS-driven tool page with almost no server-rendered SEO content and no H1.

Recommendation: Add a page H1 and a short intro paragraph.

2.4 Schema / Structured Data

Score: **40/100**

What Works

- src/lib/schema.ts has well-structured builders (Person, WebSite, BlogPosting, Article, BreadcrumbList, CollectionPage) with @ids, publisher, keywords
- Detail pages (3 blog posts with BlogPosting, 3 case studies with Article) emit real server-rendered <script type=application/ld+json>

Findings

Site-wide Person + WebSite schema is invisible to crawlers (next/script + RSC) **Critical**

layout.tsx renders Person + WebSite via next/script <Script> (afterInteractive), which does not emit server HTML — the JSON-LD only lives in the RSC flight payload (self.__next_f.push). Homepage serves 0 real <script type=application/ld+json> tags. Index CollectionPage schema (blog/case-studies) also collapses into the flight payload under Cache Components. Only detail pages emit real schema.

Recommendation: Replace the two next/script <Script> tags in layout.tsx with plain <script type=application/ld+json> elements; verify /blog + /case-studies CollectionPage flush to static HTML; re-verify with curl | grep and Google Rich Results Test.

Case studies typed as generic Article; no BreadcrumbList served; Person author not @id-linked **Medium**

Case studies use @type Article (should be TechArticle/CreativeWork); no BreadcrumbList in served HTML; BlogPosting/Article authors declared inline without @id to a global Person node; case studies lack datePublished; sameAs missing X.

Recommendation: Convert to TechArticle + BreadcrumbList, add full dates, tie all author/publisher to @id https://rokyuddin.com/#person, expand sameAs.

2.5 Performance (CWV)

Score: **55/100**

What Works

- Desktop fast: Performance 91, LCP 1.3s (good)
- CLS = 0 on both mobile & desktop (stable layout)
- All images next/image; fonts self-hosted via next/font (no Google Fonts dependency); correct preloads

Findings

Mobile LCP 4.7s (POOR) driven by JS + third-party **High**

Mobile lab: Performance 68, LCP 4.7s, FCP 3.0s, TBT 310ms. 424KB JS across 18 scripts (1.2MB un-minified), ~116KB unused JS, GA4 gtag.js (167KB, 42% unused) preloaded at High priority steals connection slot from LCP image. Hero image preloaded but lacks fetchpriority=high. No CrUX field data (low traffic).

Recommendation: Add priority to the hero <Image>; stop high-priority-preloading GA4 (or drop GA4, keep Cloudflare analytics); trim unused JS; shrink oversized 1536x1024 case-study images.

Double analytics (GA4 + Cloudflare Web Analytics) **Medium**

Both GA4 (gtag.js 167KB) and Cloudflare beacon.min.js present — redundant ~180KB third-party.

Recommendation: Keep one analytics tool for a portfolio; defer GA4.

2.6 AI Search Readiness

Score: **68/100**

What Works

- All AI crawlers allowed (robots.txt User-Agent: * Allow: /) — no bot blocked
- llms.txt present with above-average quality (name, role, stack, location, contact)
- Citability 68/100 — homepage + AltSEO case study are strong, quotable, hedge-free
- Clear H1>H2>H3 passage structure; clean entity definition in content

Findings

llms-full.txt missing (404) **Low**

llms.txt exists but /llms-full.txt returns 404; no per-page summaries of the most quotable case studies.

Recommendation: Add llms-full.txt with expanded bio + per-case-study metric summaries; add X handle to Contact.

Blog posts not citable (generic, fact-free) **Medium**

Blog posts contain almost no numbers/dates/original data — a model would cite Next.js docs instead of the post.

Recommendation: Inject 2-4 concrete first-person data points per post (Lighthouse delta, bundle-size, latency).

Homepage entity schema invisible to AI crawlers **High**

AI crawlers reading raw HTML get ZERO schema on the homepage (Person/WebSite only in RSC payload) — the page most important for entity binding.

Recommendation: Render homepage Person+WebSite schema as static server HTML.

2.7 Images

Score: **70/100**

What Works

- All images use next/image with alt text (verified 13 images on homepage, none missing alt)
- CLS 0 — images have dimensions or are lazy-loaded
- Responsive srcset/sizes emitted correctly

Findings

Oversized case-study images (1536x1024 served at ~750px) Medium

Case-study thumbnails source from Sanity at 1536x1024 PNG but display ~500-750px — ~69KB waste; homepage OG image is ~1MB.

Recommendation: Request smaller w/crops from Sanity; confirm WebP/AVIF delivery; compress the OG image.

3. Action Plan

Phase 1: Critical Fixes Week 1

- Fix layout.tsx: replace next/script <Script> with plain <script type=application/ld+json> for Person + WebSite (site-wide schema becomes visible) — 5 min
- Resolve www/non-www canonical conflict: set NEXT_PUBLIC_SITE_URL=https://www.rokyuddin.com (fixes canonicals, sitemap, robots Host, OG, schema URLs at once); resubmit sitemap in GSC
- Verify /blog + /case-studies CollectionPage schema flushes to static HTML (Cache Components), re-test with curl | grep + Rich Results Test
- Fix broken DEFAULT_SOCIAL_IMAGE (/twitter-image.jpg -> /twitter-image) affecting 6 pages

Phase 2: High-Impact Improvements Weeks 2-3

- Improve mobile LCP: add priority/fetchpriority=high to hero Image; stop high-priority-preloading GA4 or drop it (keep Cloudflare analytics)
- Trim unused JS (~116KB) and de-duplicate double analytics; lazy-load below-the-fold sections to cut TBT/INP
- Add About page + standalone Contact page + persistent site footer with social/contact links
- Refresh or restructure the blog: update to 2026-dated deep posts, retitle/remove 'Modern Web Design Trends 2024', add first-person data to make posts citable
- Fill or remove the empty Client Testimonials section
- Fix duplicate H1s on blog posts and duplicate meta descriptions

Phase 3: Content & Authority Month 2

- Build hub-and-spoke content clusters (Next.js, TypeScript, Frontend Performance, React, Design Engineering) — publish long-tail spokes before pillars
- Internal-link case studies + homepage authority into blog clusters (Rydr/AltSEO/Skinsight to relevant posts)
- Back case-study metrics with screenshots/links; convert case-study schema to TechArticle + BreadcrumbList
- Address domain migration: re-claim/redirect rokyuddin.vercel.app, replace old URL in velora-ui repo + bios; point high-authority profiles (GitHub, LinkedIn, dev.to) at canonical URL
- Add security headers (CSP, nosniff, Referrer-Policy)
- Expand llms.txt + add llms-full.txt; add homepage FAQ + FAQPage schema

Phase 4: Monitoring & Iteration Ongoing

- Verify CrUX field CWV once traffic grows past eligibility (~1k Chrome pageviews/28 days); connect GSC if credentials available
- Add fetchpriority and image-size hygiene to new content; subset fonts (subset:['latin'])
- Track long-tail rankings first, then earned links, then head terms (6-12 months)
- Re-run this audit as a drift baseline after deploying the critical fixes

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)

Report generated by Claude SEO — Google SEO Intelligence Skill — August 25, 2026
Methodology based on Google Web Vitals thresholds, Search Console documentation, and Lighthouse scoring algorithms.
